

Storage in the Cloud TASK – 1

- 1. Create a new S3 bucket in your AWS account with a unique name that includes your initials and the current date (e.g., mybucket-AB-20240618). Set the region to Asia Pacific (Mumbai).**

Ans :

- Sign in to AWS Console
- Open the AWS Management Console and log in to your account.
- Search for S3 in the services menu and open the Amazon S3 dashboard.
- Create a new bucket
- Enter a unique bucket name using your initials and the current date.
- Choose the AWS Region
- Under AWS Region, select:
 - Asia Pacific (Mumbai) ap-south-1
- Configure bucket settings
 - Keep Object Ownership as the default setting unless your assignment requires otherwise.
 - Keep Block all public access enabled for security.
 - Enable Bucket Versioning if you want to keep multiple versions of files.
 - Leave other settings as default.
- Create the bucket

2. Upload three different files (an image, a PDF, and a text file) to your new S3 bucket using the AWS Management Console. Make sure each file has a meaningful name related to your favorite app (e.g., instagram-logo.png, spotify-playlist.pdf, zomato-menu.txt).

Ans :

- Open your S3 bucket
- Go to the Amazon S3 Console.
- Select the bucket you created earlier (for example, mybucket-AB-20260714).
- Upload files
- Click the Upload button.
- Click Add files and select three files from your computer:
 - Image file: spotify-logo.png
 - PDF file: spotify-playlist.pdf
 - Text file: spotify-favorites.txt
- Make sure the file names are meaningful and related to your favorite app.
- Review upload settings
- Keep the default settings for permissions and storage class.
- Ensure the files are uploaded as Private for security.
- Upload the files
- Click Upload.
- Wait until all three files show a successful upload message.
- Verify the upload

- Return to the bucket contents page.
- Confirm that the following files are visible:
 - spotify-logo.png (image file)
 - spotify-playlist.pdf (PDF document)
 - spotify-favorites.txt (text file)

**3. Set the access permissions on one of your uploaded files so it is publicly accessible via a URL. Test the link in your browser to confirm it works.

Hint: Use the 'Make public' option in the AWS S3 console and copy the object URL.**

Ans :

- Open your S3 bucket
- Go to the Amazon S3 Console.
- Open the bucket you created earlier.
- Select one uploaded file (for example, spotify-logo.png).
- Change file permissions
- Click on the file name to open its details.
- Go to the Permissions tab.
- Use the Make public option (if available).
- Confirm the action to allow public access to that object.
- Copy the Object URL
- Open the file details page.
- Under the Object URL section, copy the URL provided by AWS.

- Test the URL
- Open a new browser tab.
- Paste the copied Object URL.
- Press Enter.
- The file should open directly in the browser (for example, the image should display).
- Verify access
- If the file loads without signing in to AWS, the public access setting has been successfully applied.

**4. Enable versioning on your S3 bucket, then upload a new version of one of your files (e.g., upload an updated zomato-menu.txt with different content). Check the version history to confirm both versions are stored.

Hint: Use the 'Versions' tab in the bucket to view all versions.**

Ans :

- Enable bucket versioning
- Open the Amazon S3 Console.
- Select your bucket (for example, mybucket-AB-20260714).
- Go to the Properties tab.
- Find Bucket Versioning and click Edit.
- Select Enable Versioning and save the changes.
- Upload a new version of an existing file
- Open the Objects tab of your bucket.
- Upload a file with the same name as an existing file.

- Example:
 - Existing file: spotify-favorites.txt (contains your original playlist details)
 - Updated file: spotify-favorites.txt (contains additional songs or updated information)
- Click Upload to replace the file.
- Check version history
- In your S3 bucket, enable the Show versions option.
- Open the Versions view.
- Each version will have a unique Version ID and timestamp.
- Confirm successful versioning
- Verify that both versions are stored and available.
- You can restore an older version anytime by selecting it and choosing the appropriate restore or download option.

5. Write a short comparison (3-4 sentences) explaining the main differences between AWS S3, EBS, and Glacier. Mention which one you would use for storing Instagram profile pictures, Flipkart order history, and old IRCTC booking records, and why.

Ans : AWS S3, EBS, and Glacier are different storage services designed for different purposes. Amazon S3 is an object storage service used for storing and accessing files easily, so it would be suitable for Instagram profile pictures because images need to be quickly available to users. Amazon EBS is block storage designed for applications that need fast access to data, so it would be useful for Flipkart order history databases where frequent read and write operations are required. Amazon Glacier (S3 Glacier) is a low-cost

archival storage service, making it ideal for old IRCTC booking records that need to be kept for a long time but are rarely accessed.
