

Security in the Cloud TASK – 1

- 1. Log in to the AWS Management Console and navigate to the IAM dashboard; take a screenshot of the Users section showing the default view.**

Ans :

- Open a web browser and go to the AWS Management Console:
 - Sign in using your AWS account credentials.
- In the AWS Console search bar, type IAM and open the IAM (Identity and Access Management) service.
- From the IAM dashboard, select Users from the left navigation pane.
- Wait for the Users page to load.
 - The default view should display the list of IAM users.
 - It may show columns such as:
 - User name
 - Access key status
 - Last activity
 - Creation date
 - Groups

- 2. Create a new IAM user named InstaUploader and assign programmatic access only. Download the access key file and note where you saved it.

Hint: Do not attach any permissions yet—just create the user and save the credentials.**

Ans :

- Sign in to the AWS Management Console.
- Navigate to IAM (Identity and Access Management).
- In the left navigation pane, click Users.
- Click Create user.
- Enter the user name:
 - InstaUploader
- When prompted for access type:
 - Enable Programmatic access (or, in the newer IAM experience, create the user first and then create an Access key for CLI/SDK use).
 - Do not enable AWS Management Console access.
- Continue through the wizard without attaching any permissions.
- Review the settings and click Create user.
- After the user is created, create or view the access key (if required by the current IAM interface), then download the credentials as a .csv file.

3. Create a group called ContentCreators in IAM, then add the InstaUploader user to this group.

Ans :

- Sign in to the AWS Management Console.
- Open IAM (Identity and Access Management).
- In the left navigation pane, click User groups (or Groups in the older IAM interface).
- Click Create group.

- Enter the group name:
 - ContentCreators
 - Click Create group.
 - After the group is created, open the ContentCreators group.
 - Click Add users.
 - Select the InstaUploader user.
 - Click Add users to confirm.
- 4. Write a short explanation (3-4 lines) describing the difference between an IAM user and an IAM role, using an example from any app you use daily (e.g., Zomato delivery agent vs. Zomato app admin).**

Ans : An IAM user is a permanent identity with its own login credentials or access keys, typically used by a specific person or application. An IAM role is a temporary identity that is assumed when needed and provides permissions without long-term credentials. For example, in Zomato, a delivery agent is like an IAM user because they have their own account, while the app assigning temporary delivery tasks is like an IAM role, granting access only for a specific purpose and duration.
